Abstract

Aim of the chapter is to analyse long-term changes of the selected socio-demographic population features in the area, where numerous brownfields originated in industrial and deep-mining activities are located. As an example of such area cadastral area of Kuncicky (Slezská Ostrava city district) was chosen. This example clearly shows spreading of industrial activities and its links with population development in the area, where industrial function prevailed in time over housing. In the first part literature retrieval on this topic was carried out, which is followed by the analysis of historical development of the area, its industrialisation, consequent long-term population changes, changes of housing stock and its spatial contexts. Last part is devoted to recent problems of such type of deindustrialised area.
